Summary

GenAI-focused Software Engineer with 2+ years of experience building LLM-powered applications, agentic RAG workflows, asynchronous AI APIs, and inference pipelines. Uses Python, FastAPI, LangGraph, vector search, tool calling, and local/cloud model integration to turn AI capabilities into usable software. Delivered measurable improvements in LLM costs, data-pipeline execution time, and inference latency.

Skills

Languages: Python, JavaScript, SQL

AI Engineering: Generative AI, LLMs, RAG, AI Agents, LangChain, LangGraph, MCP, Prompt Engineering, Structured Outputs, Tool Calling, Embeddings, Vector Search, Hugging Face, OpenAI GPT, Claude, Gemini, Llama, Ollama

Backend: FastAPI, Flask, REST APIs, AsyncIO, Pydantic, Node.js, Express.js

ML & Computer Vision: PyTorch, TensorFlow, OpenCV, YOLO, ONNX Runtime, vLLM

Databases: PostgreSQL, MongoDB, FAISS, ChromaDB, Qdrant, Pinecone, pgVector

Cloud & Tools: AWS, Docker, Linux, Git, GitHub Actions, Nginx, CI/CD, Firebase Functions

Frontend: React.js, Vue.js

Experience

Software Engineer — AI & Backend Engineer **Aug 2026 – Present**
Everninebrands, Noida, India

- Working on an AI-driven marketing operations and digital-growth platform focused on website analysis, search visibility, AI-search readiness, and automated growth workflows.
- Re-architected the internal AI query system by optimizing prompt design and query flow, reducing token usage and associated LLM costs by approximately **80%** while preserving output quality.
- Optimized the **DataForSEO pipeline** through efficient API orchestration, batching, and data-processing strategies, reducing overall pipeline execution time by approximately **90%**.
- Designed and implemented high-performance data pipelines for **SEO and AI-search visibility**, enabling scalable ingestion, processing, and analysis of search performance data.
- Applied **AI-driven performance optimization** to identify system bottlenecks and improve query execution, processing efficiency, and scalability across marketing intelligence workflows.

Software Development Engineer **Aug 2025 – Jul 2026**
Saralweb, Noida, India

- Developed agentic RAG systems using **LangGraph** and vector search for context-aware retrieval and multi-step reasoning.
- Built LLM-powered workflow automation services using **FastAPI** and structured outputs, integrating model responses into predictable backend workflows.
- Designed FastAPI APIs supporting asynchronous AI inference, tool execution, and streaming AI workflows.
- Integrated MLX-based local LLM inference for Apple Silicon, building an on-device pipeline with streaming response support.
- Built GPU-optimized AI inference pipelines, reducing image generation latency by **3**× (510s → 170s).
- Architected a multi-stage gated inference framework that reduced false negatives by approximately **90%** without increasing infrastructure costs or inference load.
- Developed a deep learning-based face anti-spoofing solution using **MiniFaceNetV2**, ONNX Runtime, and multi-crop liveness validation to detect replay and printed-photo attacks across desktop and embedded environments.
- Built a real-time AI surveillance pipeline combining object detection, motion detection, and multi-stage model verification to filter false alerts.

Software Developer **Jun 2024 – Jul 2025**
Indevz, Noida, India

- Built a model-agnostic AI video generation engine supporting multiple video providers through a unified architecture, enabling new providers without changing the core pipeline.
- Developed backend services and APIs for inventory management, billing, order processing, and return workflows.
- Built serverless, event-driven applications using **Firebase Functions**, enabling real-time tracking and notifica-

tion systems.
- Implemented secure authentication and authorization using Firebase Authentication with role-based access control.

Projects

Agentic Runtime Engine

- Designing a reusable agent runtime with shared orchestration, memory, tool-execution, and model-abstraction components.
- Designed the runtime around modular agent capabilities, allowing applications to compose different models, tools, workflows, memory, and execution policies without coupling application logic to a specific LLM provider.
- Implemented agentic workflows using **LangGraph**, MCP, tool calling, structured outputs, context management, and multi-step execution.
- Built a provider-agnostic inference layer supporting local and cloud LLMs with interchangeable backends through Ollama and hosted model providers.
- Designed runtime components for tool discovery, execution, validation, state management, and controlled agent actions.
- Built the architecture as a reusable foundation for multiple AI applications rather than implementing isolated task-specific agents.
- **Technologies:** Python, FastAPI, LangGraph, LangChain, Ollama, Qwen2.5, MCP, ChromaDB, nomic-embed-text

Agentic Terminal

- Built an AI-powered terminal assistant that converts natural language into executable shell commands.
- Implemented command planning, execution, validation, and explicit user approval before performing system operations.
- Developed using Python and Rust with local LLM inference for secure offline execution.

RAG Knowledge Assistant

- Built a generic RAG application that indexes local documents and retrieves relevant context before every LLM query.
- Implemented local embedding generation using `nomic-embed-text` through Ollama.

Education

Master of Computer Applications (MCA) **2025 – Present**
Indira Gandhi National Open University (IGNOU)

Bachelor of Science (B.Sc.) — Physical Sciences with Computer Science **2021 – 2024**
University of Delhi

Relevant Coursework: Data Structures & Algorithms, Object-Oriented Programming, Database Management Systems, Operating Systems, Computer Networks, Software Engineering
